Extra Energy for Extra Lambing Success with **OPTI-LIX HIGH ENERGY**

FEED
from 6 weeks
pre lambing

75% of foetal growth
within the last 6 weeks

MINIMISE
twin lamb
disease

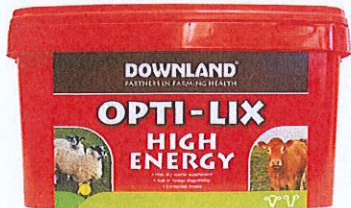

Extra High Energy
16 MJ ME / Kg

PROMOTE
udder growth
and colostrum
production

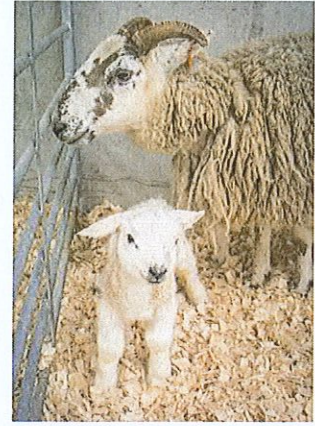

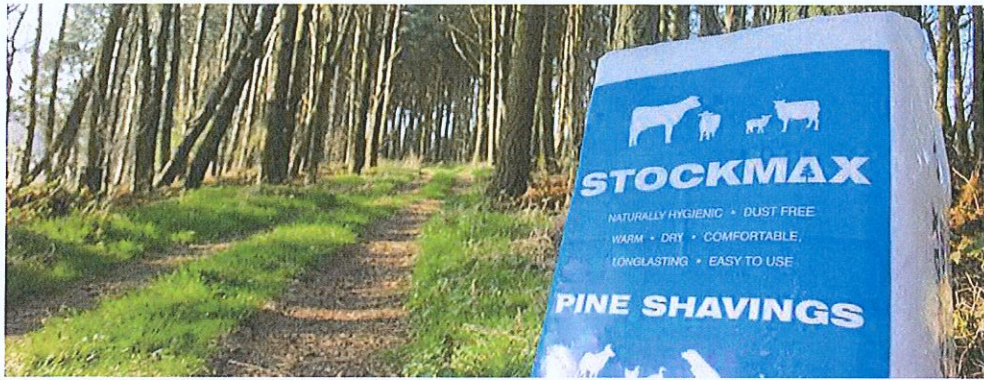

12% protein
from mixed sources

- High energy supplement
- Controlled intake

DOWNLAND®
PARTNERS IN FARMING HEALTH

**Dust-free pine shavings range creates a universal hygienic bed for animals
UK's largest horse bedding manufacturer, BEDMAX, has announced that it is
diversifying and enhancing its range of products to include STOCKMAX, branded
shavings especially for livestock.**

Using the same dust-free, pine timber shavings as its flagship BEDMAX, STOCKMAX shavings are dried at temperatures that sterilise the shavings, STOCKMAX is easy to use and provides a warm, dry and absorbent bed for a diverse array of animals.

Due the antibacterial properties, which help reduce deaths caused by infection, primarily, E. coli, STOCKMAX is the ideal bedding for sheep during lambing. Pine completely kills off the E.coli infection and is also effective against other bacteria thus reducing the need for expensive antibiotics to treat infected lambs. Producing very little dust and spores, STOCKMAX remains dry and warm for longer, benefiting over straw, giving lambs the best possible start.

Tim Smalley, Managing Director of BEDMAX said: "We increasingly noticed that not all of our customers were horse owners and by researching the target market, we were able to identify that people were buying BEDMAX for many types of other animal's most especially sheep during lambing time."

Consider bedding options to save costs and reduce antibiotic use when lambing

With straw prices high and lambing time fast approaching, sheep farmers are being advised to consider alternative bedding options to save costs and prevent health problems.

Lambing pens can harbour significant amounts of harmful bacteria, putting animal health at risk and compromising farm profitability, so farmers should be looking at proven bedding options to prevent health problems at this critical time.

"The success of a sheep farmer's business is hugely influenced by lambing performance, and farmers have worked incredibly hard over the last few years to reduce health problems at this critical time," says Tim Smalley, Managing Director of BEDMAX.

"We welcome last week's Government report on the successful reduction of antibiotics use on UK farms," says Tim. "However, let's not get complacent; there's still a lot of work to be done and focusing on preventative methods of reducing animal disease continues to be a priority for farmers. We believe that our STOCKMAX pine shavings offer farmers a highly effective, completely natural, cost effective alternative to antibiotics in the fight against infection and the loss of lambs that result from it.

"The E.coli bacteria – which causes the most serious infections in the lambing pen – and E. Faecium are the most widespread and serious health threats to housed animals, particularly at lambing time, both thrive in the warmth and moisture of manure and urine in bedding.

"STOCKMAX is made from 100% pine, and research we have discovered or commissioned over the past 16 years has proved that pine contains natural defense mechanisms that eliminate a wide range of harmful bacteria and fungal spores, including these two prevalent bacteria. Our experience with sheep farmers using BEDMAX originally and more recently STOCKMAX over the past five years or more has shown very clear evidence that it works very effectively to combat or prevent infections that pose the greatest threats to sheep and lambs in the lambing pen."

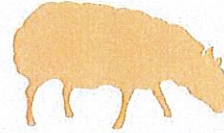

"Our sales of STOCKMAX pine shavings have almost doubled in the last 12 months, which reflects the success of this 100% British made and fully traceable bedding option. Reports from customers have confirmed this bedding option eliminates or dramatically reduces both the incidence of infection and, as a result, the need for antibiotics and costly treatments.

"We are continually investing in research and development to understand the science that makes our shavings work for our customers, and improve our processes to make them work even more effectively. But the best proof of success comes from our customers, and we're delighted that STOCKMAX is clearly helping farmers where it really matters, in the lambing pen and on the bottom line."

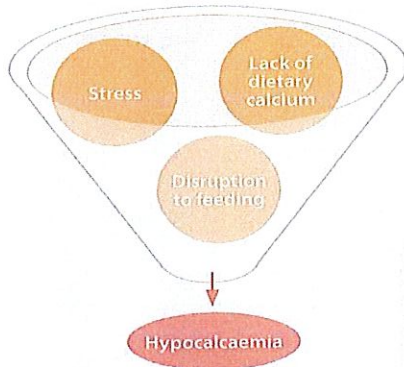

Hypocalcaemia in Ewes

Hypocalcaemia means low blood calcium levels and occurs when the demands on the ewe exceed the calcium supplied by the diet.

The condition is most frequently seen in the last four weeks of pregnancy or in the early stages of lactation when demand for calcium is at its greatest.

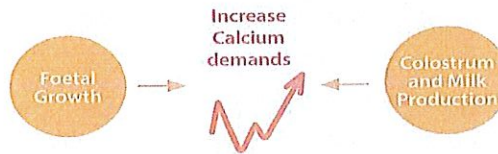

Trigger Factors

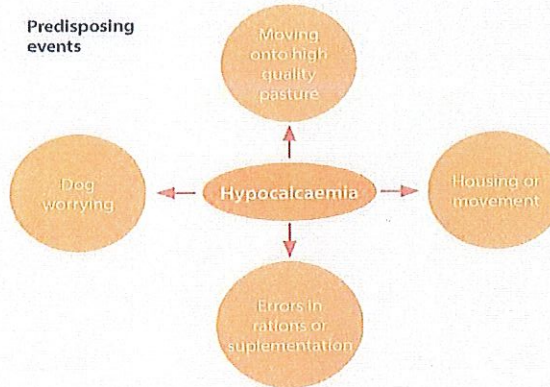

Older ewes and those carrying multiples are most risk.

Can occur alongside problems such as twin lamb disease.

Late Pregnancy Calcium Requirements

Predisposing events

If Hypocalcaemia is identified or suspected, then prompt supplementation with a bioavailable calcium source is required.

Prevention should include:

- Ensuring calcium levels in the diet match the ewes' requirements.
- Minimising where possible events causing stress or disruption of feeding.
- Additional targeted supplementation when required.

Signs include

- | |
|-----------------------|
| Weak and depressed |
| Bloat or rumen stasis |
| Ruminal reflux |
| Collapse and death |

NETTEX
LAMMING SOLUTIONS

CalciEwe+
500ml

- High-calcium drench to be administered at the first signs of a calcium deficiency
- Contains propylene glycol to support energy status
- Palatable formulation in a 500ml bottle with applicator tube
- Convenient and easy to use when needed
- Contains multiple calcium sources to support calcium availability
- Supporting ewe health and milk production at times of stress
- Can be used alongside Nettex Multi Lamb Rapid

Product Features	Benefits
Multiple Calcium sources	<ul style="list-style-type: none"> • Highly bio available forms of calcium • Forces Ca to cross the intestinal tract into blood circulation • Aids in the maintenance of calcium homeostasis
Propylene Glycol	<ul style="list-style-type: none"> • Supports energy status • Absorbed to enter gluconeogenesis via pyruvate • Increases plasma glucose • Decreases plasma non esterified fatty acids
Nicotinamide (Niacin Pre-Cursor)	<ul style="list-style-type: none"> • Important enzymatic factor • Increases energy intake and inhibits lipolysis. • Has a metabolic capacity to suppress NEFA mobilisation from fat deposits

Life Aid Spray

A combination of herbal tinctures to stimulate a healthy reaction from all major organs of the body. Commonly used for newborn puppies, kittens, calves and lambs to initiate or stimulate respiration to newborns that are failing to thrive following difficult birth or Caesarean section.

Presented in spray bottle containing 30ml.

Suggested use:

One spray directly into mouth when required. Repeat every 10-15 mins until improvement is seen.

Lamb Force Twin Lamb liquid

Available in 500ml and an economical 1lt flock pack. Supporting lamb dependence prior to birth this complementary feedstuff supplies vital energy to ewes carrying multiple lambs. The compliment of vitamins, trace elements and the addition of L-carnitine, to aid the burning of stored fat for fuel, assist a nutritionally challenged ewe.

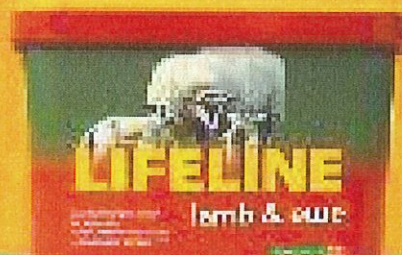

Scour Ezze

Is a complimentary feed for calves & lambs for the maintenance of normal gut motility. Contains Pectins & Kaolinitic clays to maintain gut motility Fructo oligo saccharides as feed source for beneficial bacteria in the intestinal system,

**Proven to increase
colostrum quality
by up to 25%***

*25% increase in colostrum IgG

Providing lambs with the...
ZEST FOR LIFE
Improving performance in early life and feed efficiency to maximise growth.

DOWNLAND
PARTNERS IN FARMING HEALTH

What is the nutritional package that makes up Pro-Zest in Downland Lambing products ?

1. High colostrum protein, lower non colostrum protein – In the short period of time before gut closure as much colostrum protein must be absorbed as possible, maximising Actual Efficiency of Absorption (AEA) and natural immune support. Other proteins, such as Whey Protein concentrates found significantly in colostrum supplements have a dilution affect, potentially limiting the AEA by competing with colostrum before the gut closes. Pro-Zest contains high ratios of natural colostrum, used in preference to other whey protein fillers. High ratios of colostrum proteins helps increase probability of absorption from the gut, the presence of other proteins can have diluting affect and therefore risk efficacy.
2. Enriched with digestible fats from coconut oil – Coconut oil is a readily available healthy fat source, providing energy while feeding the gut itself. A healthier gut means better digestion and absorption of nutrients to fuel growth and development of a thrifty lamb.
3. More soluble ingredients – Less complex proteins and simple fats help achieve easier mixing to save time and get the product into the animal quicker. Soluble ingredients are by nature absorbed more effectively to a healthy growing lamb/calf in the first hours of life.
4. Freeze Dried colostrum source – Pro-Zest contains a high level of colostrum from freeze dried natural sources. A less aggressive drying process to spray dried, freeze drying means the proteins in the product have potentially not been damaged during processing, keeping them intact means they better support health lamb and calf development. Freeze drying helps ensure the nutrients stay intact. Reflecting the prominent practice on farm of freezing natural colostrum. Alternative supplements can use spray dried sources which are processed using more direct heating methods
5. Nustart/Proviox/OTM – Micro-nutrients including natural antioxidants and gut friendly prebiotics, helping support gut function and natural immune development to help optimise development of healthy digestive & immune

BLITZ

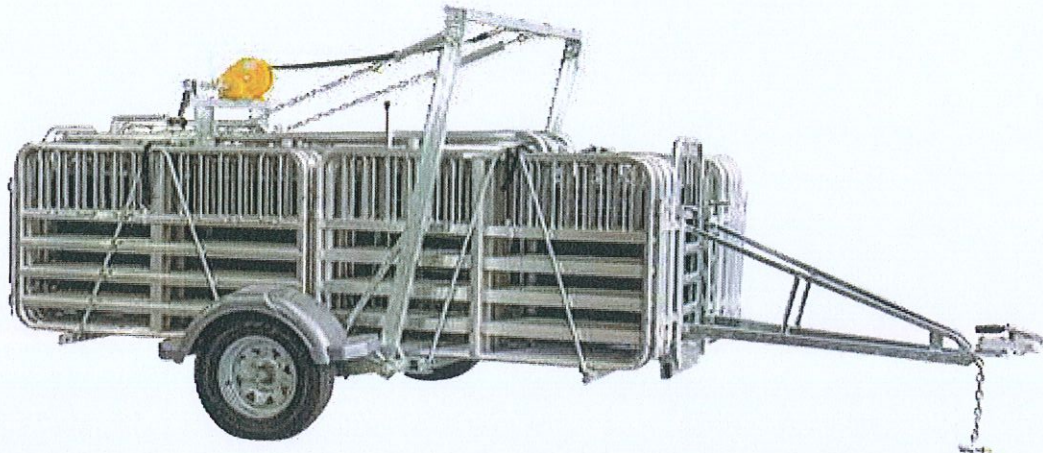

- Effective against all viruses, bacteria and fungi
- Non hazardous at in-use dilutions
- Will not pollute or taint
- Does not cause mis-mothering
- DEFRA listed

Treat all surfaces in the lambing area, it is safe to re-stock immediately or to spray round ewes and lambs. Re-spray pens between lambing.

Use BLITZ to disinfect teats and bottles; drain but do not rinse.

THE DISINFECTANT OF CHOICE FOR LAMBING

Prattley 10' Mobile Yard

£9999.00+vat

Finance available over 3 years

Drafting Race

- Allows 3 way drafting
- Durable, easy to clean Uniboard side
- Hot dip steel galvanised race frame

Suspension Safety Springs

- Heavy duty
- Back winch off one turn once loaded (slacken stop) to allow weight to sit on suspension

Safety Winch

- 5 to 1 ration
- Automatic braking winch
- Easy winding
- Gives full control over the load feeding in and out
- Hot dip galvanised
- Made in New Zealand

Toolbox

- Durable plastic
- Convenient storage
- Custom moulded

Wheels

- 13" wheel
- 8 ply tyre
- 5 stud, 1500kg hub

Pinned Gates

- Lightweight gates concentra for easy set up
- Slotted lugs and pin assembly allows effortless setup on undulating ground and greater pen flexibility

Staples

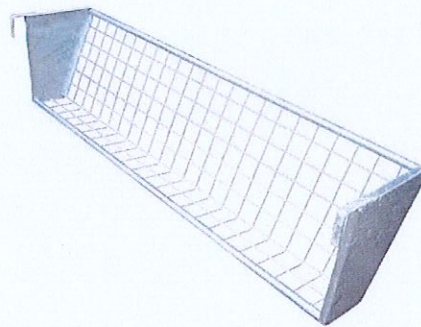

- To reduce stock and dogs getting legs caught
- Helps prevent gates getting caught in the wind
- Aids in keeping the gates lightweight

Ketosis, pregnancy toxaemia, twin lamb disease in sheep.

What causes ketosis (pregnancy toxaemia) in ewes?

Ketosis is a metabolic disease that can affect ewes during late pregnancy. In the final 6-8 weeks of pregnancy, the foetus(es) increases in size by approximately 60%. This growth demands large amounts of energy and unfortunately coincides at a time when the ewe's daily dry matter intake is reduced due to reduced space.

When ewes are not fed according to their energy requirements, they start to mobilise body fat to try and compensate for the lack of energy. However, excessive fat breakdown produces ketone bodies which when produced in large quantities can become toxic, causing the ewe to be off her feed which further increases the low energy supply.

What are the symptoms in affected ewes?

Ewes showing early signs of pregnancy toxaemia will often be dull, may separate themselves from the main flock and may appear twitchy or nervous. Ewes that have been suffering from pregnancy toxaemia for a few days will be thin, unable to stand, may appear blind and will unlikely want to eat.

How can it be prevented?

By ensuring ewes are in the correct body condition score in the pre-lambing period, ewes will be able to maximise their dry matter intake (fat ewes are likely to eat less) in the run up to lambing.

Scanning ewes during mid pregnancy and feeding them according to litter size will also help prevent pregnancy toxaemia. Avoid stressful situations (gathering with dogs and unnecessary handling) in late pregnancy and if there is a heavy snowfall and forage availability is reduced, supplementary feeds should be provided.

Management of pregnancy toxaemia:

Prompt treatment when ewes show signs of energy deficiency will increase the chance of a successful recovery. It is important that affected ewes have access to fresh, palatable feeds and water to reduce dehydration and to promote feed intake.

At the first signs of energy deficiency, ewes should be given a good quality energy drench containing: Propylene Glycol and Glycerol which are rapidly available sources of energy.

Vitamins, trace elements and amino acids to support energy metabolism, liver function and the immune system.

Keto Pro is an orally administered solution for use as an aid in the reduction of the risk of ketosis.

Unique fermentation-based product containing

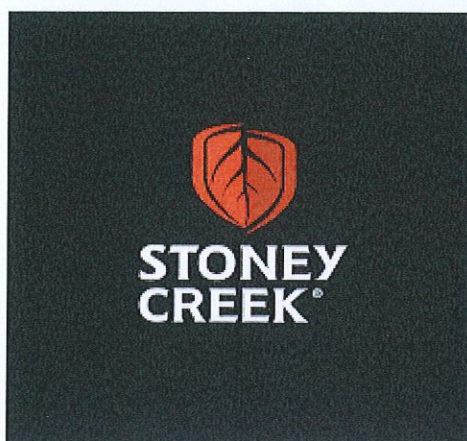

Trace elements & Vitamins

Dual energy power pack

Liver support pack

For Derbyshire sheep farmer John Kirkham, keeping his ewes in the ideal condition as lambing approaches is key to helping them achieve a successful lambing. With 2018's season just around the corner, **OPTI-LIX** High Energy low moisture licks will once again be offering him peace of mind as the flock approaches the most nutritionally demanding period of the ewe's production cycle.

It's safe to say that John's flock face more testing conditions than many sheep across the UK, and with the farm rising to 1200ft above sea level, it makes the run up to lambing ever more challenging at this sheep producer's farm in Hartington, Derbyshire.

Lambing 600 Mule ewes indoors over a 4-week period means there isn't much time to spare at this Derbyshire farm in April, even with all hands on deck. This makes the maintenance of healthy ewes and an easy lambing especially favourable in order to maximise lambing success.

"Having a ewe in good condition that will lamb easily and go on to feed her lambs with plenty of milk is key", states John.

OPTI-LIX High Energy licks are offered from December through to lambing alongside ad-lib

forage, with compound feed being introduced from 6 weeks pre-lambing. "The buckets help with twin lamb disease, especially in my older ewes and triplets" says John. "The ewes take to them well and they last longer than standard buckets whilst still keeping the ewes in good condition".

The controlled product intakes have also had an extra benefit for John, "I don't need to put fresh buckets out as often and I know the sheep will be okay for a while as the product is long-lasting, especially if my sheep are on winter keep", he explains – a major advantage when ewes cannot be visited as frequently as they would be at home.

OPTI-LIX High Energy is available as 20kg buckets and 80kg tubs, and is the ideal supplement for ewes in the run up to lambing. The product contains an extra high energy level (16MJ ME/kg DM), high levels of available sugars (35%) plus minerals and vitamins to support ewe health and lamb vitality at lambing time.

TREAT EWES AND PROTECT YOUR LAMBS

THE BEST ADVICE

Protect your lambs by treating ewes at or around lambing. From two weeks pre lambing until six weeks post lambing ewes are more likely to shed worm eggs due to decreased immunity. This is known as the 'spring rise' and can contaminate the pasture and greatly affect lambs.

Reducing the risk of lambs becoming infected reduces the disease risk and allows lambs to thrive.

There are many products available to help with the control of parasites; getting the most from their active ingredients is key in ensuring ideal livestock performance and reducing risk of resistance. When choosing products for your livestock farm's needs it is important to make an informed choice. Incorporating a rotating regimen of active ingredients in your health plan will help to minimise the risk of anthelmintic resistance. This should be discussed with your animal health adviser.

THE CORRECT PRODUCT

A 2017 study³ found that injecting ewes with a long-acting moxidectin such as **ZERMEX**®, led to low worm egg counts in lambs throughout the study period. Comparatively, ewes that were left un-treated or dosed with a short-acting wormer showed higher worm egg counts in lambs.

The long-acting group showed reduced pasture contamination and higher lamb growth rates.

Between shearing and weaning when lambs were grazing, lambs from ewes treated with the long-acting product had numerically² improved growth rates; they outgrew the untreated control lamb group by 1.7kg and the short-acting group by 0.7kg. Which could equate to an additional £3 per lamb, in a 60-day period.

INCREASED
GROWTH
OF UP TO
1.7
KILOGRAMS²

THE BEST VALUE

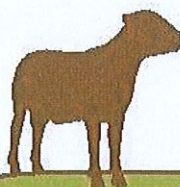

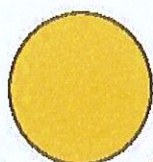

The low egg counts in the lambs from the ewes treated with long-acting moxidectin resulted in a reduced need to treat. Less treatment saves money, lowers work-load, reduces the stress on the lambs and therefore lowers the overall cost of production.

¹ at £1.77/kg liveweight (in a 60 day period vs lambs from untreated ewes³).

² P Value = 0.156.

³ Kerr et al 2017 A practical farm-based trial to compare ewe nematode control strategies in periparturient ewes, in press.

All **ZERMEX**® brands contain moxidectin, POM-VPS. For further information see the SPC, farmers should contact their animal medicines supplier SQP, veterinary surgeon or Downland Marketing Ltd, 15 Victoria Place, Carlisle, CA1 1EW. Use medicines responsibly: www.noah.co.uk/responsible. AH083/18

Downland Sheep Natural Energy Buckets

SHEEP NATURAL ENERGY

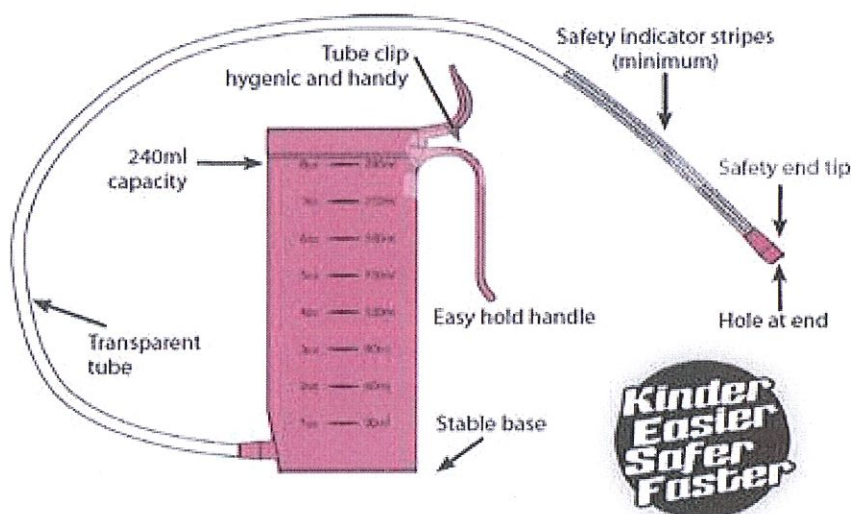

is a unique and specially formulated feed supplement to be fed to ewes to boost energy and protein supply during the critical tupping to lambing period. Feed throughout pregnancy to maintain good ewe health and condition to ensure both ewe and lamb are in peak health as lambing approaches. The high energy dense formulation will help meet the ewes considerable demand for energy pre-post lambing, and will assist in combating twin lamb disease.

13.5 mj energy
Contains fish oil for omega 3
Helps revert twin lamb disease
Balanced vits & mins
High Vit E for lamb vigour
High selenium in the form of Selplex

FEEDING EWES POST-LAMBING WITH SHEEP NATURAL ENERGY			NO ADDITIONAL MAGNESIUM SUPPLEMENTS REQUIRED
HIGH LEVELS OF SOYA  Supports ewe milk production	HIGH ENERGY Supports ewe body condition, milk production and lamb growth 	FULLY MINERALISED  including protected zinc & selenised yeast - Helps support optimal ewe health and performance	 Provides the recommended daily level of magnesium when risk of staggers exists  DOWNLAND PARTNERS IN FARMING HEALTH

FEATURES

FURTHER ADVANTAGES

- One handed operation.
- Easy clean design and material.
- Milk into vial straight from ewe or nanny.
- Clean the whole tube - no build up in tip.
- Gravity fed, not pressurised.
